# 1 Introduction

The software system being developed is a google images downloader command line tool that will allow end users to download a certain number of googles images given specific keywords and parameters. The aim of this tool is to provide assistance to those involved in machine learning, and secondarily those involved in art.

After completing the first stage of the design, the Software Requirements Specification (SRS), this document, the Module Guide (MG) is developed (Parnas et al., 1984). The MG specifies the modular structure of the system and is intended to allow both designers and maintainers to easily identify the parts of the software. After the MG is completed, the Module Interface Specification will be done which specifies the externally observable behaviour of a module using precise mathematical language.

A module is a work assignment for a programmer or programming team(Parnas et al., 1984). The primary design principle being followed when decomposing the system into modules is the principle of information hiding (Parnas, 1972). This principle supports design for change, because the “secrets” that each module hides represent likely future changes.

Other design principles follow the rules laid out by Parnas et al. (1984). They are as follows:

- System details that are likely to change independently should be the secrets of separate modules.
- Each data structure is used in only one module.
- Any other program that requires information stored in a module’s data structures must obtain it by calling access programs belonging to that module.

The rest of the document is organized as follows. Section 2 lists the anticipated and unlikely changes of the software requirements. Section 3 summarizes the module decomposition that was constructed according to the likely changes. Section 4 specifies the connections between the software requirements and the modules. Section 5 gives a detailed description of the modules. Section 6 includes two traceability matrices. One checks the completeness of the design against the requirements provided in the SRS. The other shows the relation between anticipated changes and the modules. Section 7 describes the use relation between modules.

Date	Name	Version	Notes
2/26/2020	Nick	1.0	Created document
3/9/2020	Sam	1.1	Filled in admin details
3/9/2020	Sam	1.1.1	Started adding modules
3/10/2020	Josh, Sam, Nick	1.1.2	First iteration of all sections completed

## 2 Anticipated and Unlikely Changes

This section lists possible changes to the system. According to the likeliness of the change, the possible changes are classified into two categories. Anticipated changes are listed in Section 2.1, and unlikely changes are listed in Section 2.2.

### 2.1 Anticipated Changes

Anticipated changes are the source of the information that is to be hidden inside the modules. Ideally, changing one of the anticipated changes will only require changing the one module that hides the associated decision. The approach adapted here is called design for change.

**AC1:** Google Images will likely change the way that their HTML is presented, warranting a change in the Navigate Page Module.

**AC2:** As use of the application grows, there will be demand for new features.

### 2.2 Unlikely Changes

The module design should be as general as possible. However, a general system is more complex. Sometimes this complexity is not necessary. Fixing some design decisions at the system architecture stage can simplify the software design. If these decision should later need to be changed, then many parts of the design will potentially need to be modified. Hence, it is not intended that these decisions will be changed.

**UC1:** Input/Output devices (Input: File and/or Keyboard, Output: Images downloaded to a directory).

**UC2:** The system will always take in user input from either from the command line or from a file.

## 3 Module Hierarchy

This section provides an overview of the module design. Modules are summarized in a hierarchy decomposed by secrets in Table 2. The modules listed below, which are leaves in the hierarchy tree, are the modules that will actually be implemented.

**M1:** Hardware-Hiding Module

**M2:** Input Module

**M3:** Search Query Module

**M4:** Navigate Page Module

**M5:** Output Module

**M6:** Main Module

Level 1	Level 2
Hardware-Hiding Module	
Behaviour-Hiding Module	Input Module Search Query Module Navigate Page Module Output Module
Software Decision Module	Main Module

Table 2: Module Hierarchy

## 4 Connection Between Requirements and Design

The design of the system is intended to satisfy the requirements developed in the SRS. In this stage, the system is decomposed into modules with high cohesion and low coupling, to implement proper software design principles. These include The connection between requirements and modules is listed in Table 3.

## 5 Module Decomposition

Modules are decomposed according to the principle of “information hiding” proposed by Parnas et al. (1984). The *Secrets* field in a module decomposition is a brief statement of the design decision hidden by the module. The *Services* field specifies *what* the module will do without documenting *how* to do it. For each module, a suggestion for the implementing software is given under the *Implemented By* title. If the entry is *OS*, this means that the module is provided by the operating system or by standard programming language libraries. Also indicate if the module will be implemented specifically for the software.

Only the leaf modules in the hierarchy have to be implemented. If a dash (–) is shown, this means that the module is not a leaf and will not have to be implemented. Whether or not this module is implemented depends on the programming language selected.

### 5.1 Hardware Hiding Modules (M1)

**Secrets:** The data structure and algorithm used to implement the virtual hardware.

**Services:** Serves as a virtual hardware used by the rest of the system. This module provides the interface between the hardware and the software. So, the system can use it to display outputs or to accept inputs.

**Implemented By:** OS

## 5.2 Behaviour-Hiding Module

**Secrets:** The contents of the required behaviours.

**Services:** Includes programs that provide externally visible behaviour of the system as specified in the software requirements specification (SRS) documents. This module serves as a communication layer between the hardware-hiding module and the software decision module. The programs in this module will need to change if there are changes in the SRS.

**Implemented By:** –

### 5.2.1 Input Format Module (M2)

**Secrets:** The format and structure of the input data.

**Services:** Converts the input data into the data structure used by the input parameters module.

**Implemented By:** Google Images Downloader

### 5.2.2 Search Query Module (M3)

**Secrets:** The format and structure of the Google search query.

**Services:** Converts the processed data from the input module into a URL string representing the desired Google search query.

**Implemented By:** Google Images Downloader

### 5.2.3 Navigate Page Module (M4)

**Secrets:** The layout of the Google search page.

**Services:** Uses the processed Google search query to obtain the URL of each individual image.

**Implemented By:** Google Images Downloader

#### 5.2.4 Output Format Module (M5)

**Secrets:** The format and structure of the output data.

**Services:** Converts the processed data into output files/folders that will be written to storage.

**Implemented By:** Google Images Downloader

### 5.3 Software Decision Module

**Secrets:** The design decision based on mathematical theorems, physical facts, or programming considerations. The secrets of this module are *not* described in the SRS.

**Services:** Includes data structure and algorithms used in the system that do not provide direct interaction with the user.

**Implemented By:** –

#### 5.3.1 Main Module (M6)

**Secrets:** The control flow logic of the system.

**Services:** Controls the flow of data.

**Implemented By:** Google Images Downloader

## 6 Traceability Matrix

This section shows two traceability matrices: between the modules and the requirements and between the modules and the anticipated changes.

Req.	Modules
FR1	M2, M3, M5
FR2	M2, M3
FR3	M5
FR4	M2, M3
FR5	M2, M4
FR6	M2, M4
FR7	M2, M3
FR8	M2, M3
FR9	M1, M2, M3

## 7 Use Hierarchy Between Modules

In this section, the uses hierarchy between modules is provided. Parnas (1978) said of two programs A and B that A *uses* B if correct execution of B may be necessary for A to complete the task described in its specification. That is, A *uses* B if there exist situations in which the correct functioning of A depends upon the availability of a correct implementation of B. Figure 1 illustrates the use relation between the modules. It can be seen that the graph is a directed acyclic graph (DAG). Each level of the hierarchy offers a testable and usable subset of the system, and modules in the higher level of the hierarchy are essentially simpler because they use modules from the lower levels.
